New Copper - Gold Discovery at North Kalkaroo

Havilah Resources

Havilah Resources NL aims to become a significant producer of copper, gold, cobalt and molybdenum from its 100% owned Kalkaroo, Mutooroo and Benagerie projects, which are at advanced feasibility stage. It holds more than 6,500 km² of surrounding tenements in the highly mineralized Curnamona Province of South Australia, where it maintains an active drilling program. Deposits of iron ore, tin and hard rock uranium have been drilled, with good exploration upside. Havilah owns strategic interests in uranium explorer, Curnamona Energy (45.4%) and hot rock geothermal explorer, Geothermal Resources (58%.)

Highlights

- New copper-gold discovery on the Kalkaroo north dome
- Best results in discovery holes of 42m of 0.4 g/t Au and 29m of 0.44% Cu, with both holes bottoming in mineralisation.
- Confirmation of a previously untested major mineralized fault zone with extensive quartz stockwork veining, brecciation and alteration.
- The mineralized structure extends for over 5 km strike and is up to 300m wide where drilled.
- Excellent discovery potential for a major bulk tonnage copper-gold deposit.

Native copper from Kalkaroo

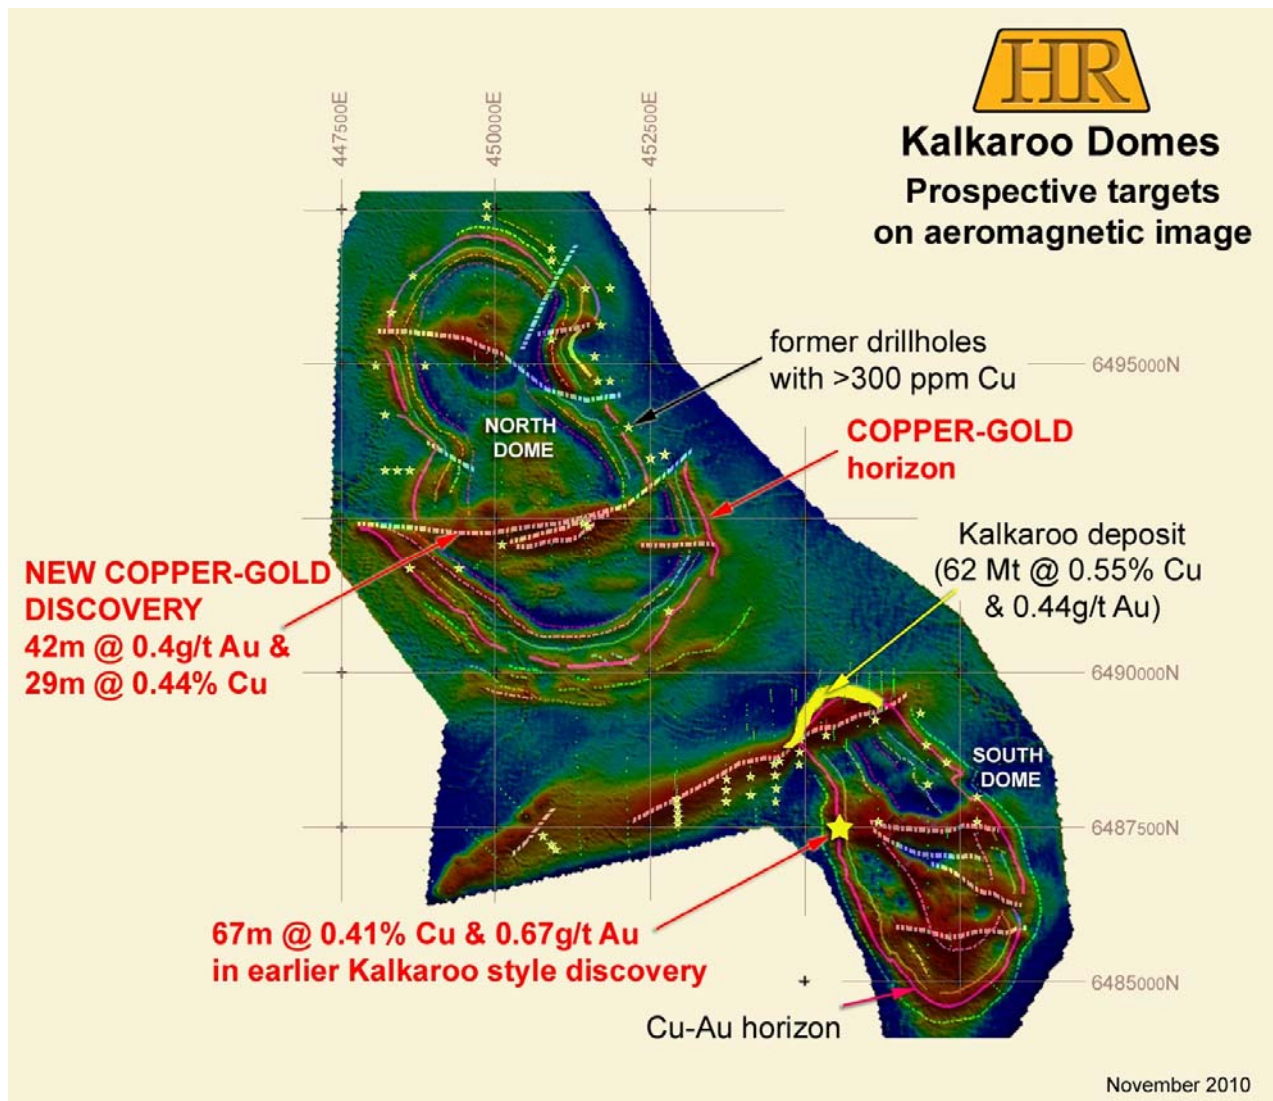

Exploration Results

Havilah Resources NL (ASX : HAV) is pleased to report that assay results recently to hand confirm a potentially significant new copper-gold discovery on the Kalkaroo north dome.

Six RC percussion drillholes were recently completed on a roughly east-west trending magnetic feature that transects the north dome, with best results of :
42m of 0.4g/t Au from 100-142 metres in drillhole KKRC372
29m of 0.44% Cu from 176-205 metres in drillhole KKRC367.

These results and anomalous gold and copper values in adjacent drillholes were returned from highly quartz veined, brecciated and altered footwall rocks, thus confirming that the magnetic feature is reflecting a mineralized fault zone. The best mineralized hole is located in a gravity trough, which is considered to reflect the most fractured and deeply weathered part of the fault zone.

Dr Bob Johnson, Havilah's Chairman, said that this was the first time the fault zone had been specifically targeted by drilling.

"We interpreted this as a potentially mineralized major structure similar to that at West Kalkaroo, and our drilling has proven us right on both counts.

"The structure is more than 5 km long and up to 300m wide where we have drilled it so far, so we think there is good scope for us to discover a large low grade gold –copper deposit.

"We have evidence that these faults are the key feeders to the replacement style copper-gold mineralisation at Kalkaroo and North Portia, so they are a very attractive target. Having now proven the concept, we have plenty of strike length to explore and discover a major new deposit " he said.

This is the second significant occurrence of new mineralisation discovered by Havilah away from the main Kalkaroo deposit. The first was an intersection of 67metres @ 0.41% Cu and 0.67 g/t Au drilled on the extension of a similar major structure to the south of the Kalkaroo.

Havilah plans to follow up this discovery with further drilling after it has completed the current resource drill out programs at its Maldorky and Lilydale iron ore projects

Competent Persons Statement

The information in this report has been prepared by geologists Dr Bob Johnson, who is a member of the Australasian Institute of Mining and Metallurgy, and Dr Chris Giles who is a member of The Australian Institute of Geoscientists. Drs Johnson and Giles are employed by the Company on consulting contracts. They have sufficient experience which is relevant to the style of mineralization and type of deposit under consideration to qualify as Competent Persons as defined in the JORC Code 2004. Drs Johnson and Giles consent to the release of the information compiled in this report in the form and context in which it appears.
