

## Havilah Resources NL

### 18 September 2006 - MORE GOLD FOUND IN CENTRAL KALKAROO DRILLING

Havilah advises that it has received further positive gold assay results for an additional three drillholes on three section lines spaced 100 metres apart, that were completed last month at the Central Kalkaroo prospect. The drilling continues to indicate wide zones of low grade gold mineralisation with significant results as follows :

Hole ID	From	To	Metres	Au g/t	Comments
KKRC120	96	111	15	1.7	3.0 g/t in last 3m of hole
KKRC122	102	123	21	0.64	Assoc. low grade Cu eg 48m of 0.12%
KKRC123	93	144	51	0.36	1.6% Cu in last 3m of hole

These holes were drilled on the eastern extension of the quartz breccia vein system, which represents a new style of gold mineralization at Central Kalkaroo as described in previous reports. The breccia vein system is interpreted to occupy a major regional fault structure that runs in a west-southwesterly direction immediately south of the Kalkaroo copper-gold orebody (see diagram).

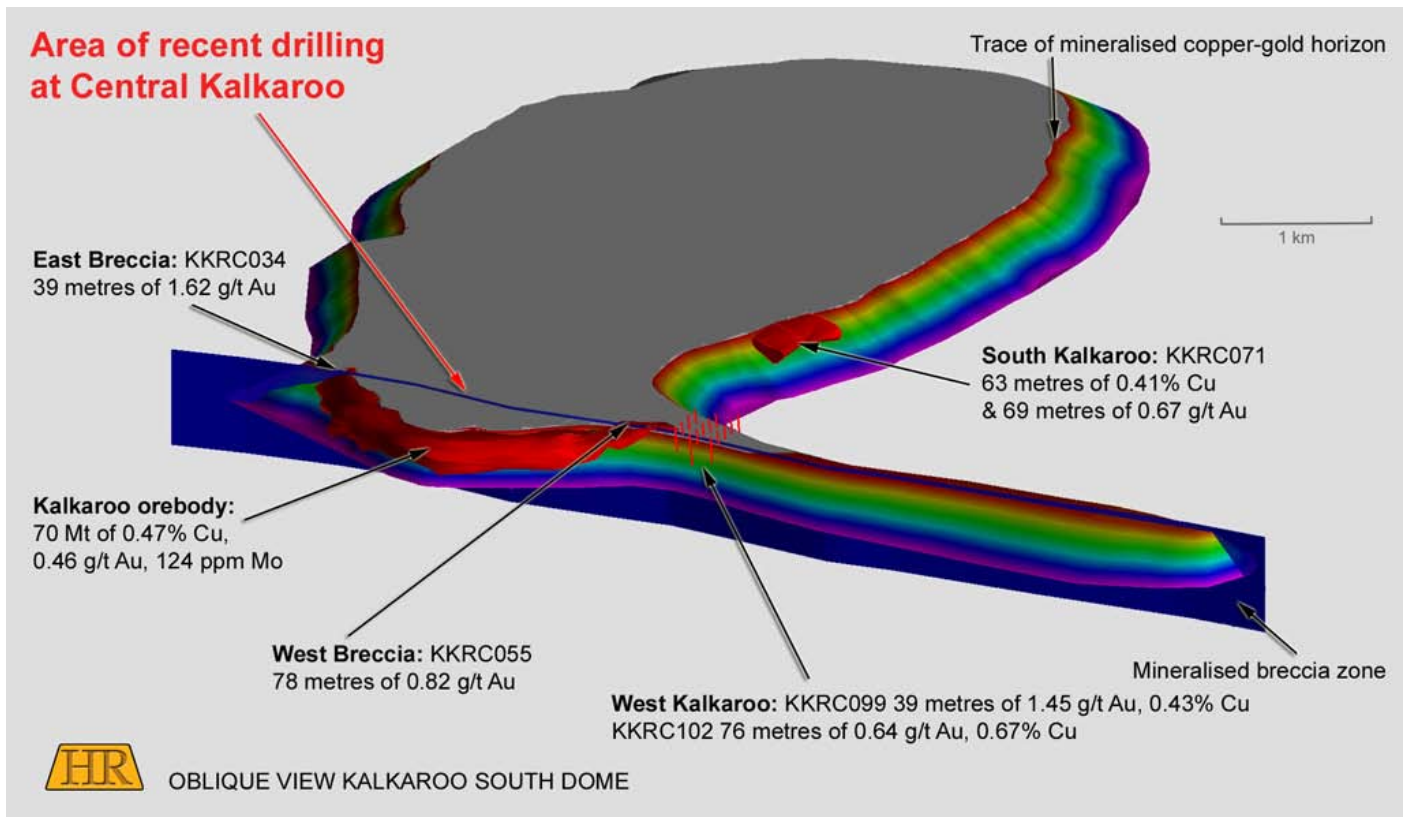

Commenting on these results, Havilah Chairman, Dr Bob Johnson said that they were geologically significant because they indicated continuing mineralization in the quartz vein breccia system over an additional 200m of strike. Considering these are exploration holes, with only one hole on each section line, they are not a definitive test of the 80 metre wide target zone, and we did well to find mineralization in each of the holes. In fact, we think the best may be yet to come because two holes ended in ore grade mineralization. Also, the gold is often associated with long intervals of low grade oxidized copper mineralisation, which is likely to be recoverable by low cost leaching methods he said.

Havilah has also completed two further percussion holes at West Kalkaroo on a section line 100 metres west of the earlier ore grade drillhole KKRC102 (previously reported 76 metres of 0.64% Cu and 0.67 g/t Au). Appreciable quantities of native copper and some copper sulphides are reported in the geologist's logging from both of these holes. Assay results for these two holes are pending and will be released when available from the laboratory.

Havilah is presently completing a 16 hole resource drilling programme for the trial gold open pit at Portia and it is expected that the drill rig will return to drilling at Kalkaroo later this week. Future drilling will aim to continue systematically expanding the Kalkaroo copper resource at West Kalkaroo along drill traverses stepping 100 metres westward. Follow up of the Central Kalkaroo gold mineralization is also a high priority and will involve drilling additional holes on existing section lines to better define the mineralization discovered to date. This programme will also test the remaining 1200 metres of untested strike of the quartz breccia vein zone within the Central Kalkaroo prospect area, including an area where a previous Newcrest aircore drillhole intersected 16 metres of 0.5 g/t Au before bit refusal at the top of the quartz breccia vein.

Havilah is pleased to acknowledge the assistance of PIRSA with this drilling via a PACE grant

Dr K R Johnson  
CHAIRMAN

The information in this report has been prepared by Dr Bob Johnson who is a member of the Australasian Institute of Mining and Metallurgy and Dr Chris Giles who is a member of The Australian Institute of Geoscientists. Drs Johnson and Giles are employed by the Company on consulting contracts. They have sufficient experience which is relevant to the style of mineralization and type of deposit under consideration to qualify as Competent Persons as defined in the JORC Code 2004. Drs Johnson and Giles consent to the release of the information compiled in this report in the form and context in which it appears.

Enquiries should be directed to Dr Bob Johnson, Chairman, on (08) 83389292
